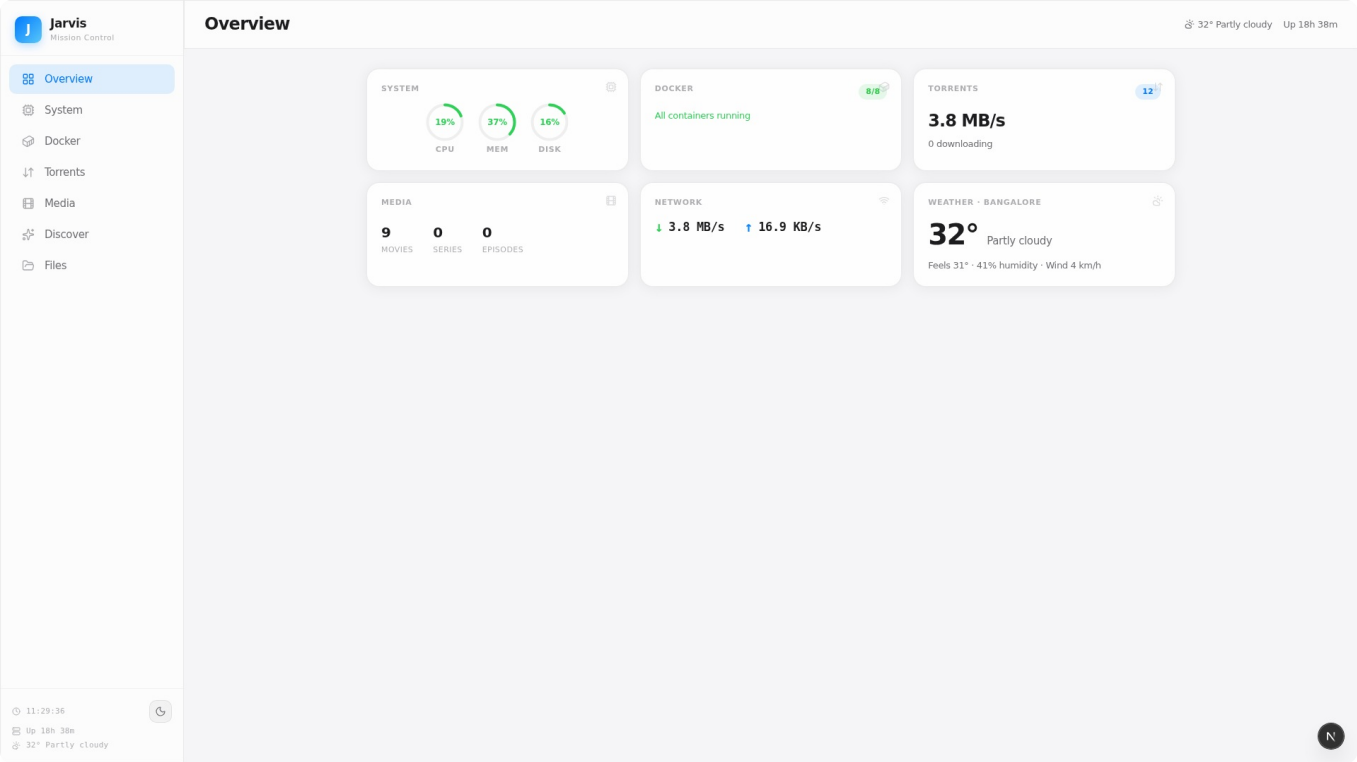
Jarvis Dashboard — Homelab Mission Control

One dashboard to monitor your server, manage Docker containers, discover movies, and download them — all without leaving the browser.

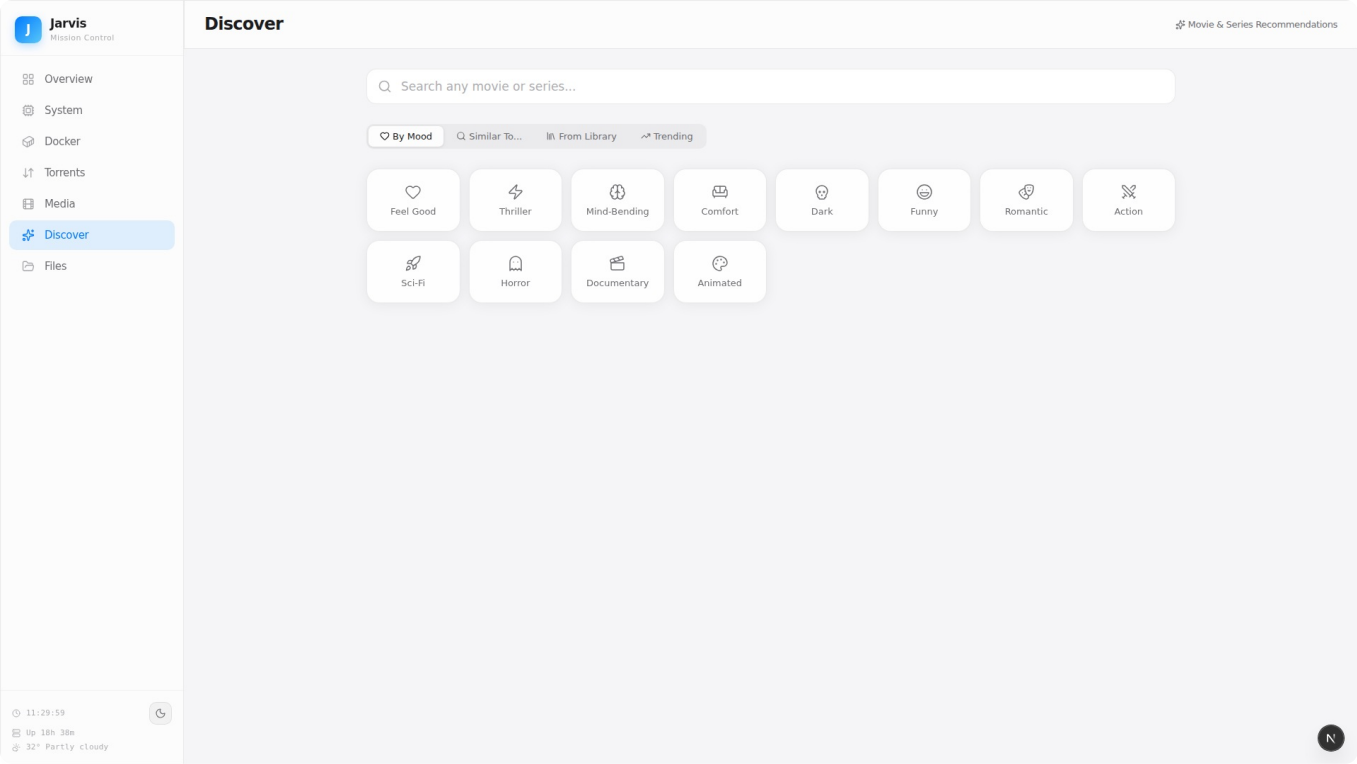


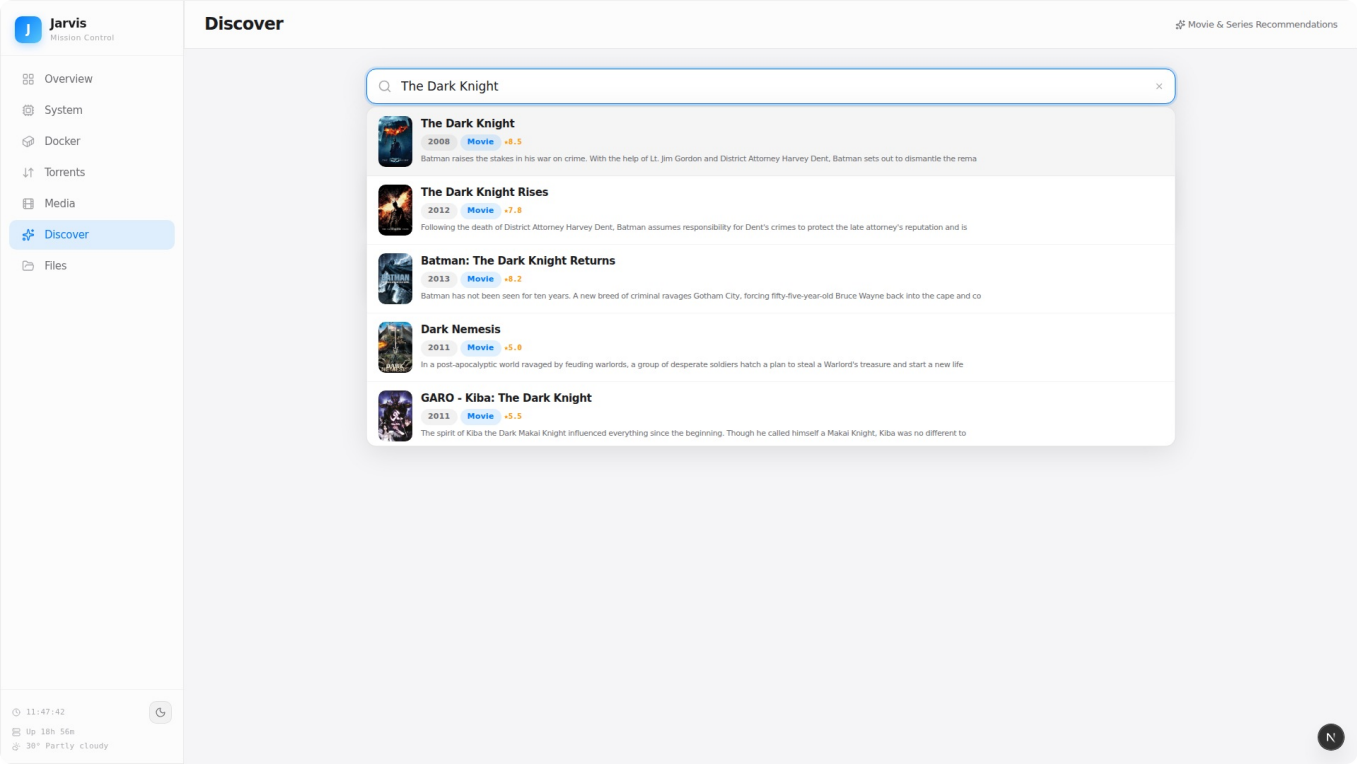
The Killer Feature: Discover → Watch

Most homelab dashboards stop at system monitoring. Jarvis goes further — it has a built-in **movie recommendation engine** that connects directly to your torrent client. The entire workflow lives inside the dashboard:

1. Pick a mood or search for anything

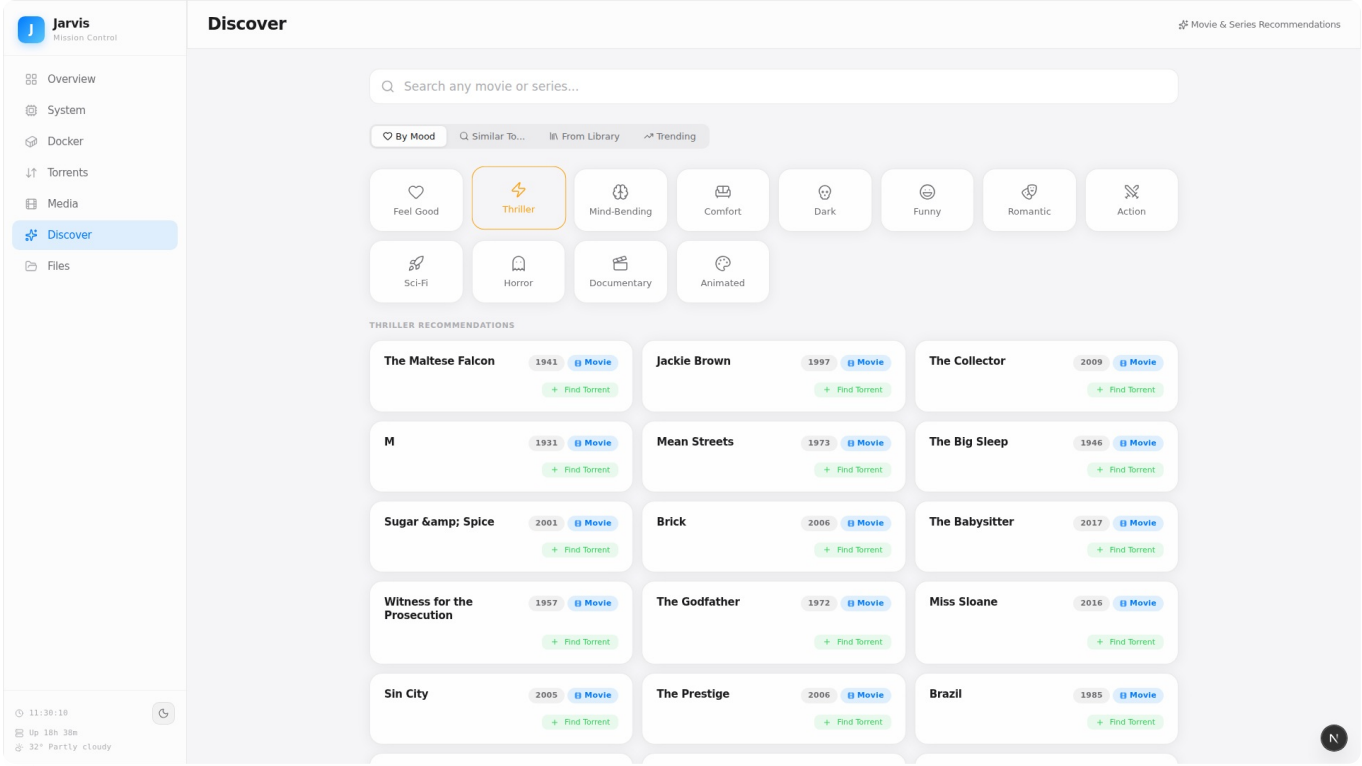
Choose from 12 moods, search by title, analyze your library, or browse what's trending.

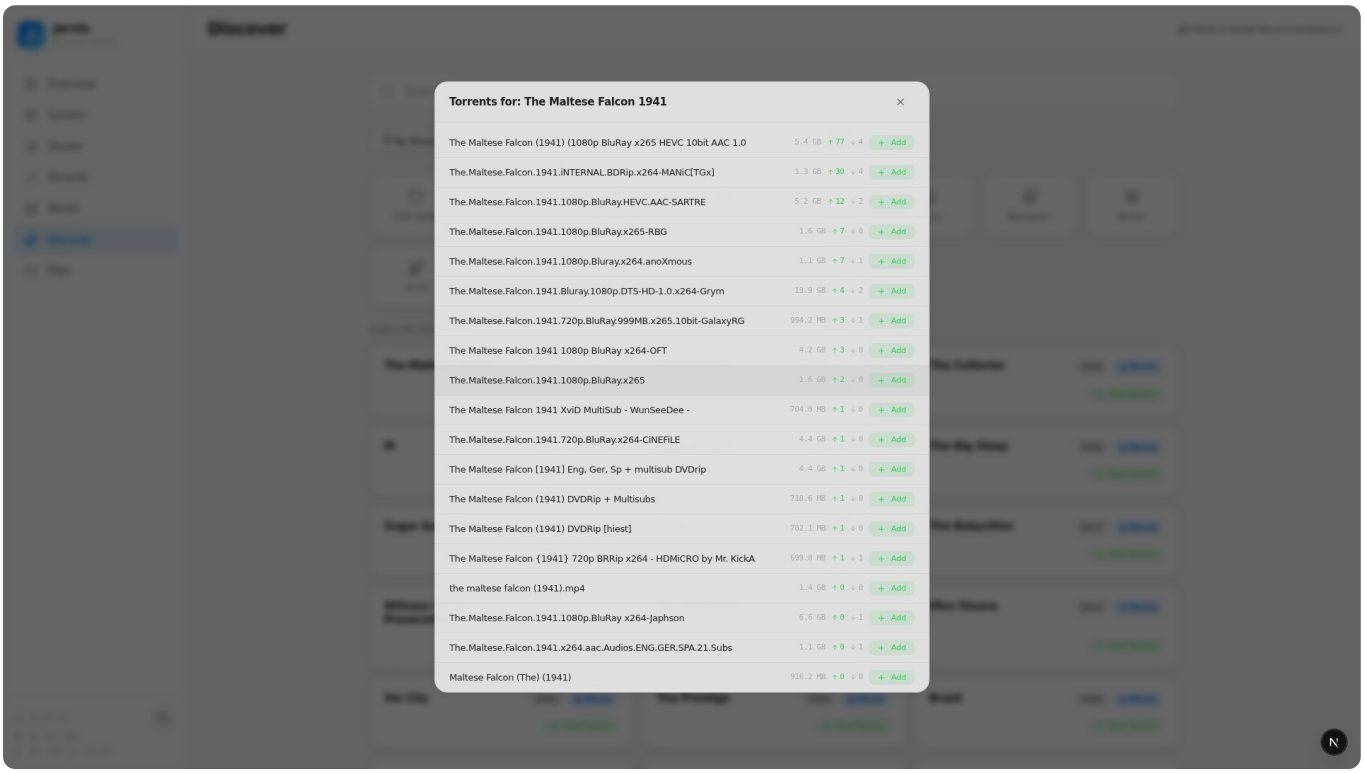




2. Get smart recommendations

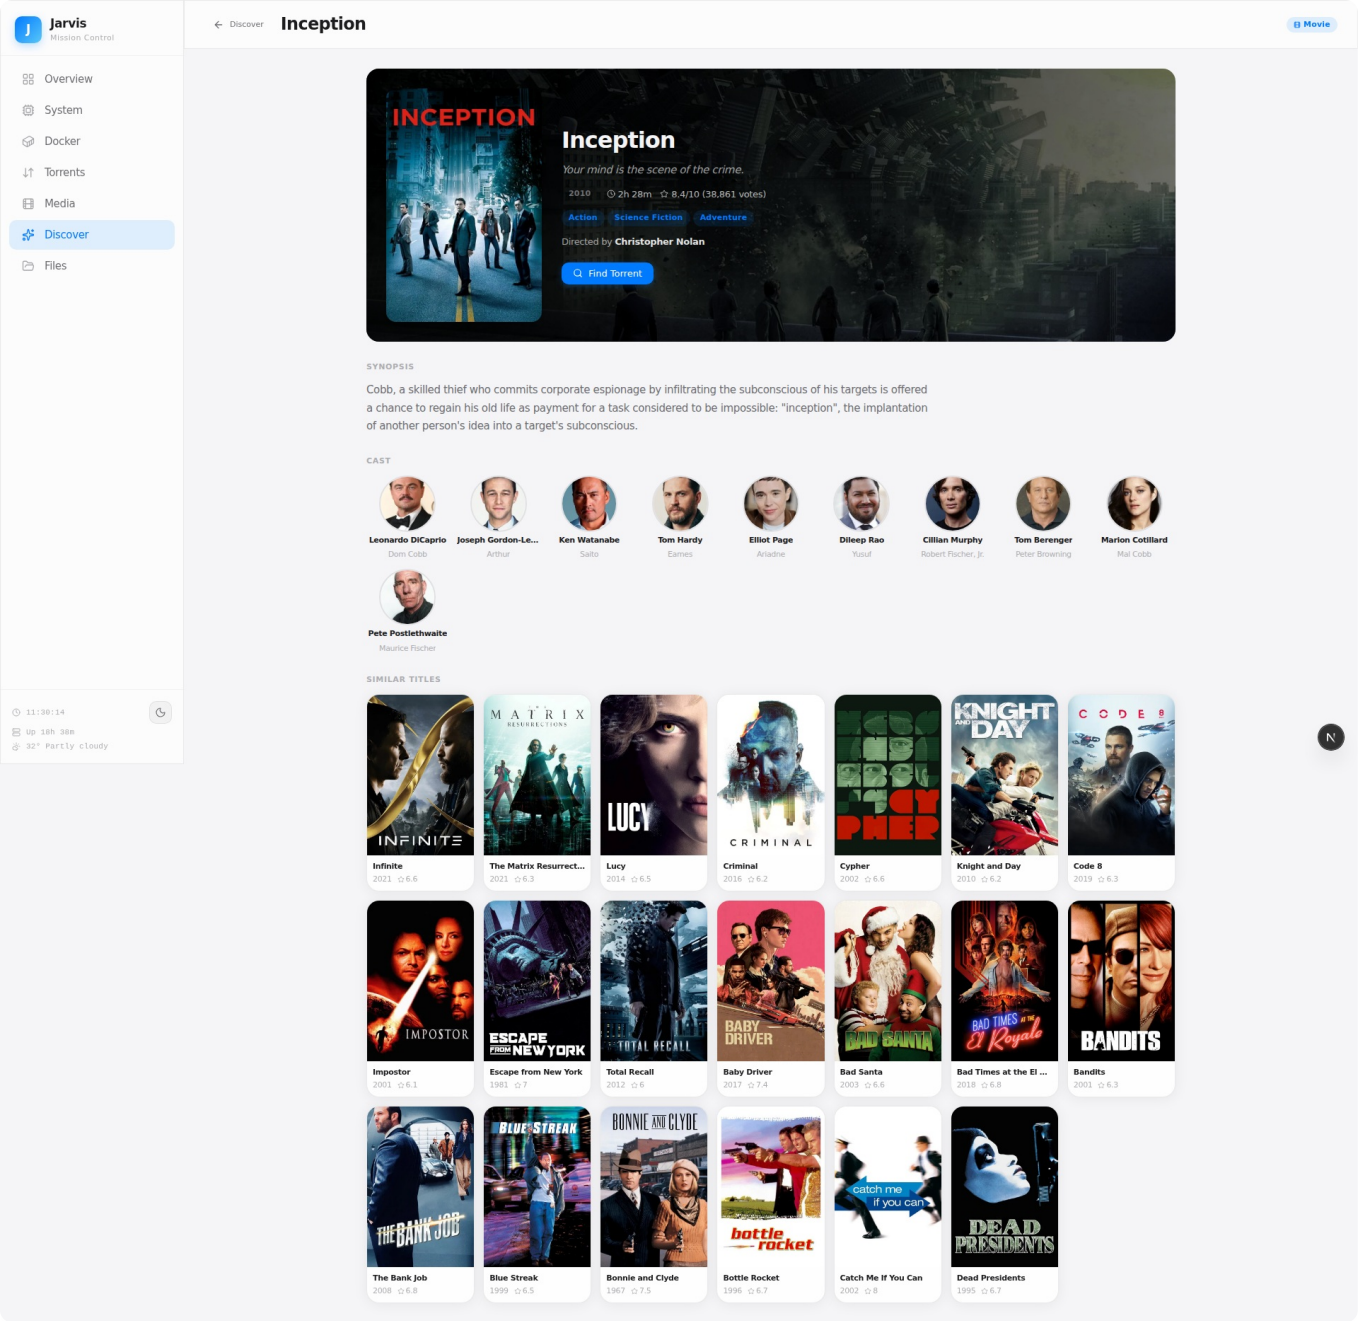
Recommendations are powered by **2,896 curated movies** from Reddit's r/MovieSuggestions wiki (120 categories) + TMDB's recommendation engine. Type a movie name and get autocomplete suggestions from the knowledge base.





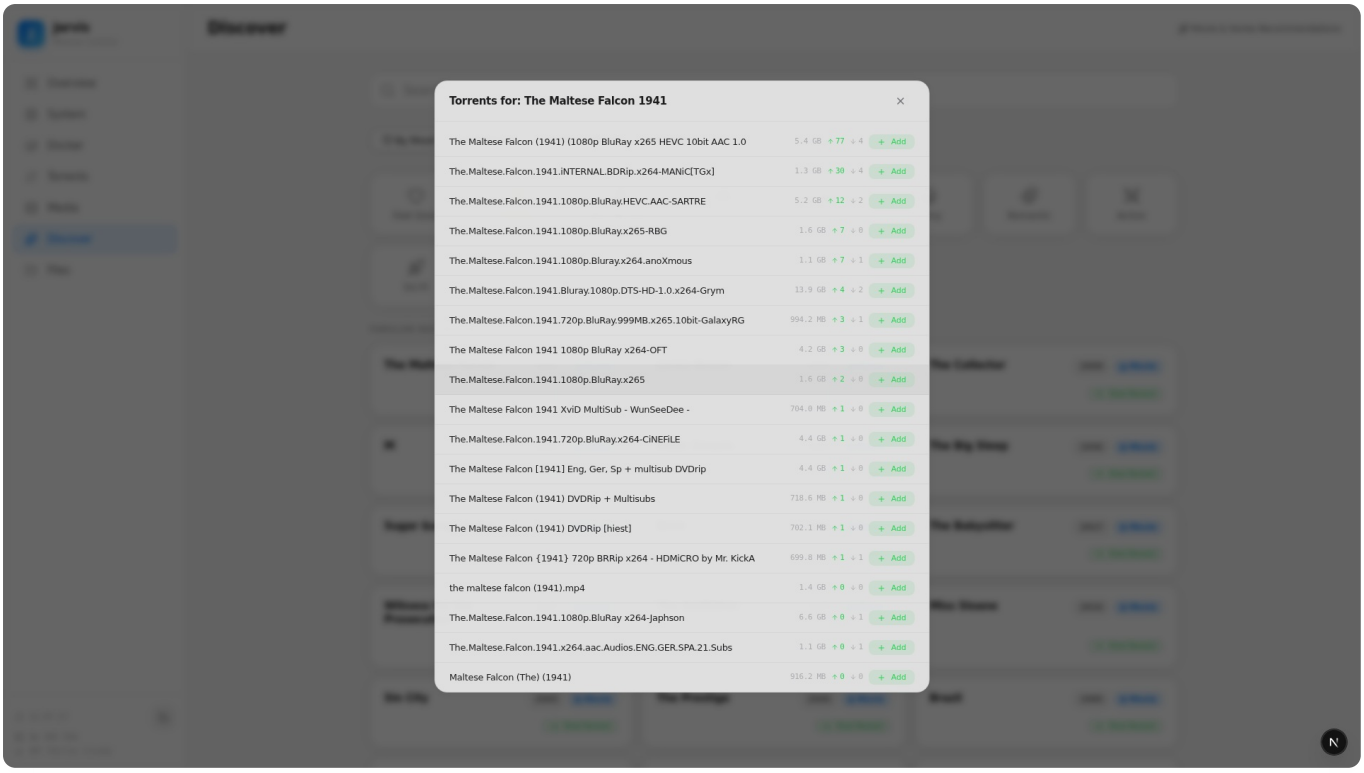
3. Explore full movie details

Click any recommendation to see the full TMDB detail page — poster, backdrop, synopsis, cast with photos, ratings, and similar titles.



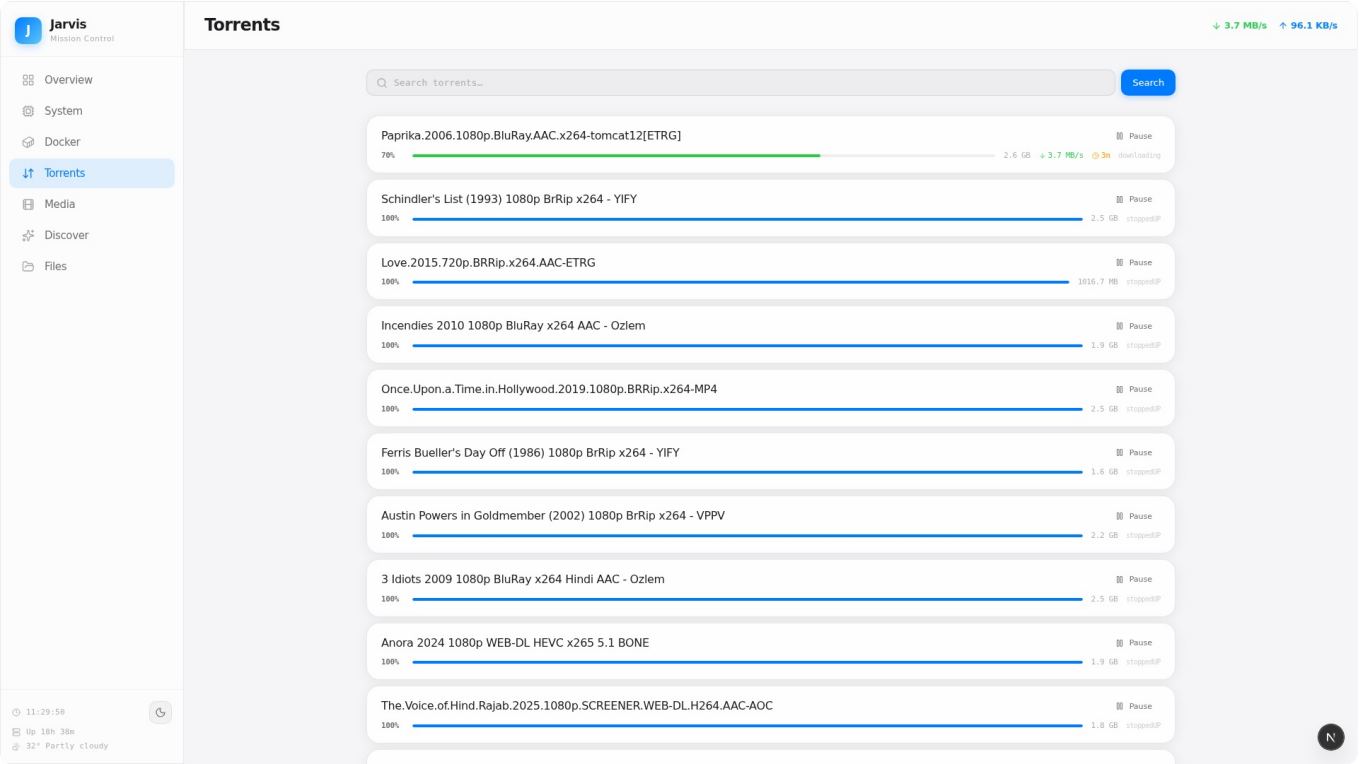
4. One click to download

Hit "Find Torrent" on any recommendation or detail page. The dashboard searches for available torrents and lets you add them directly to qBittorrent — no switching apps, no copy-pasting magnet links.



5. Track your downloads

Switch to the Torrents tab to monitor progress, pause/resume, and manage all your downloads.

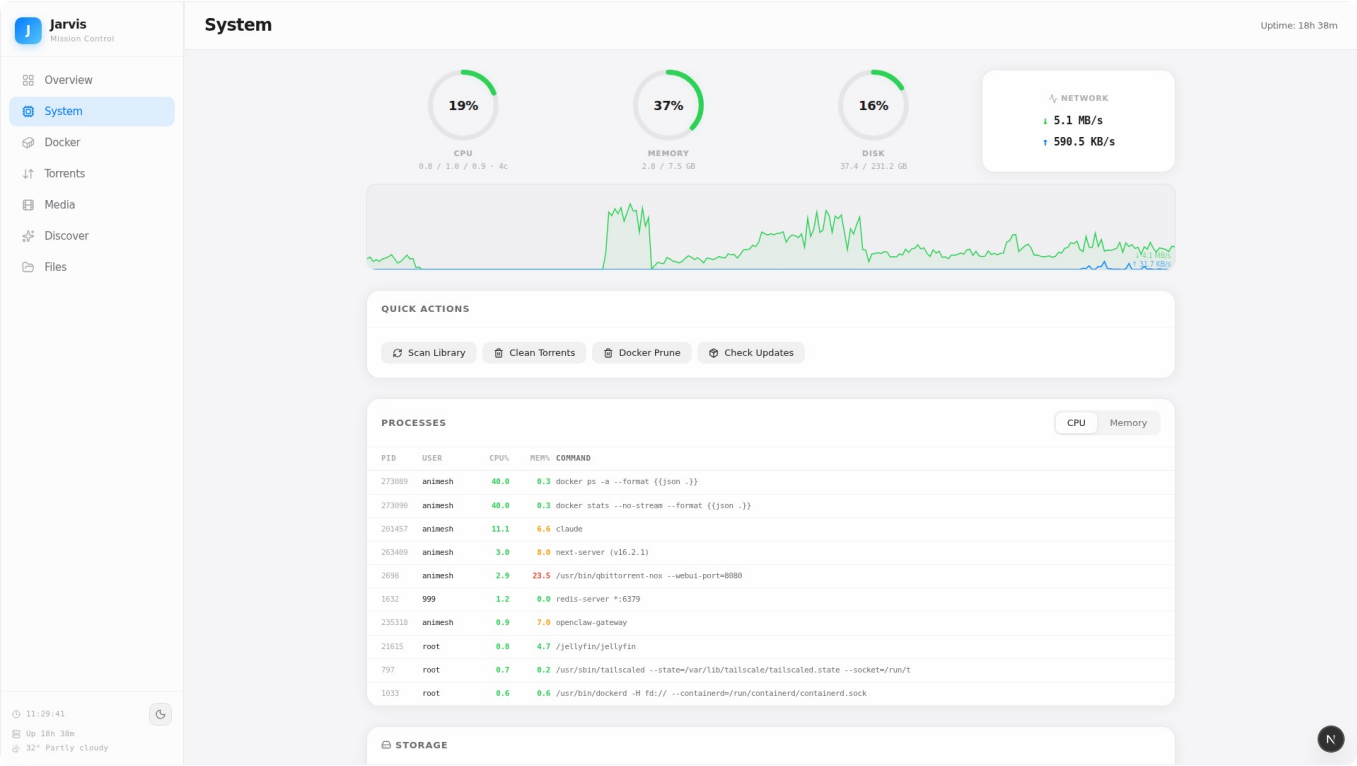


Everything Else

Jarvis isn't just a movie finder. It's a complete homelab control panel.

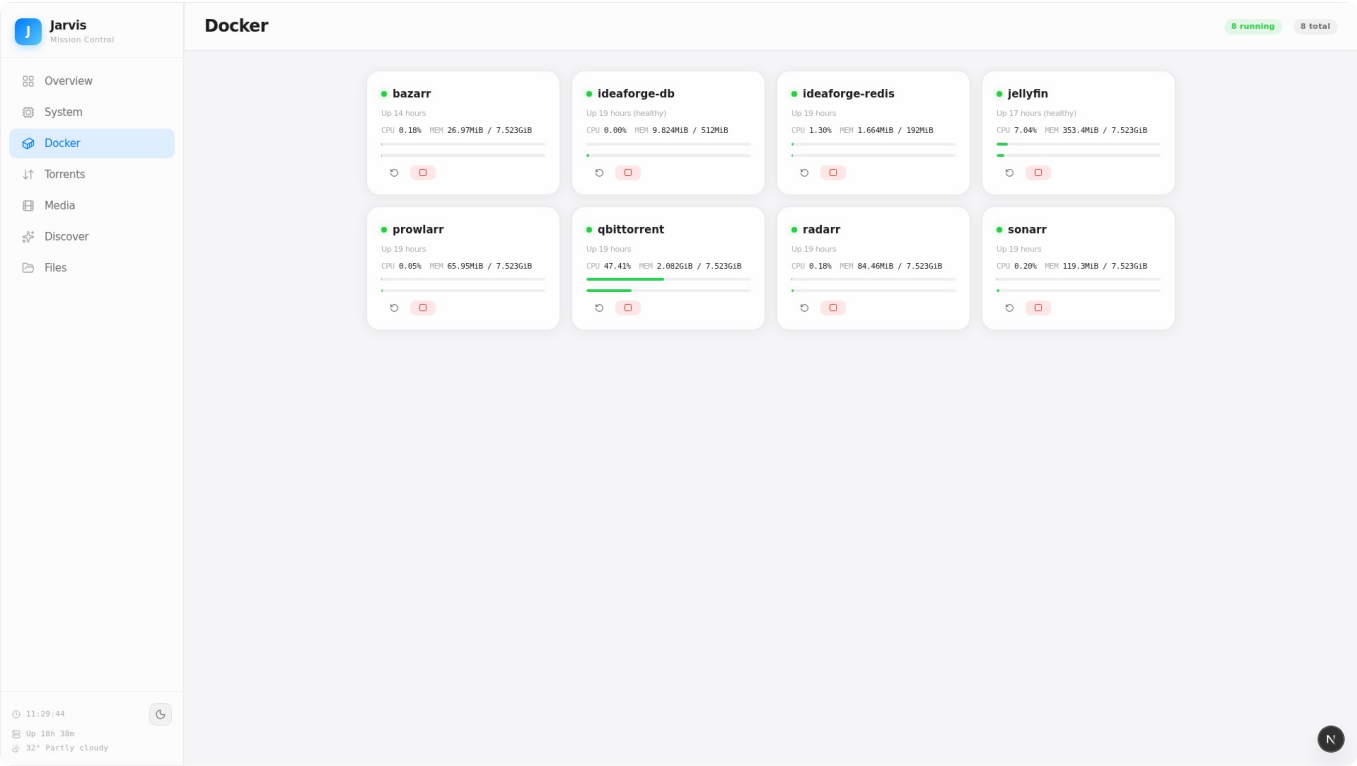
System Monitoring

Real-time CPU, RAM, and disk gauges. 30-minute bandwidth history chart. Top processes by CPU/memory. Storage breakdown by directory.



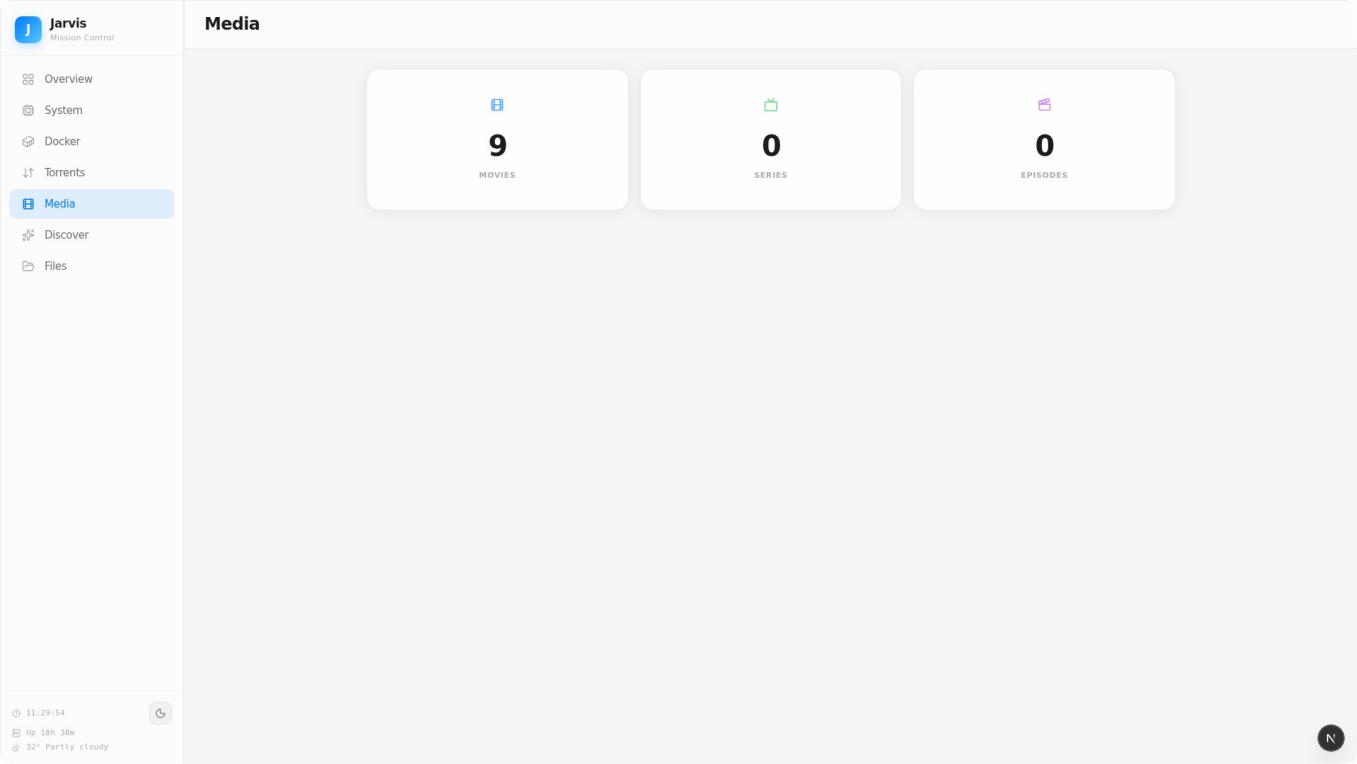
Docker Management

See all containers at a glance with status indicators, CPU/memory bars. Start, stop, restart any container. View live logs.



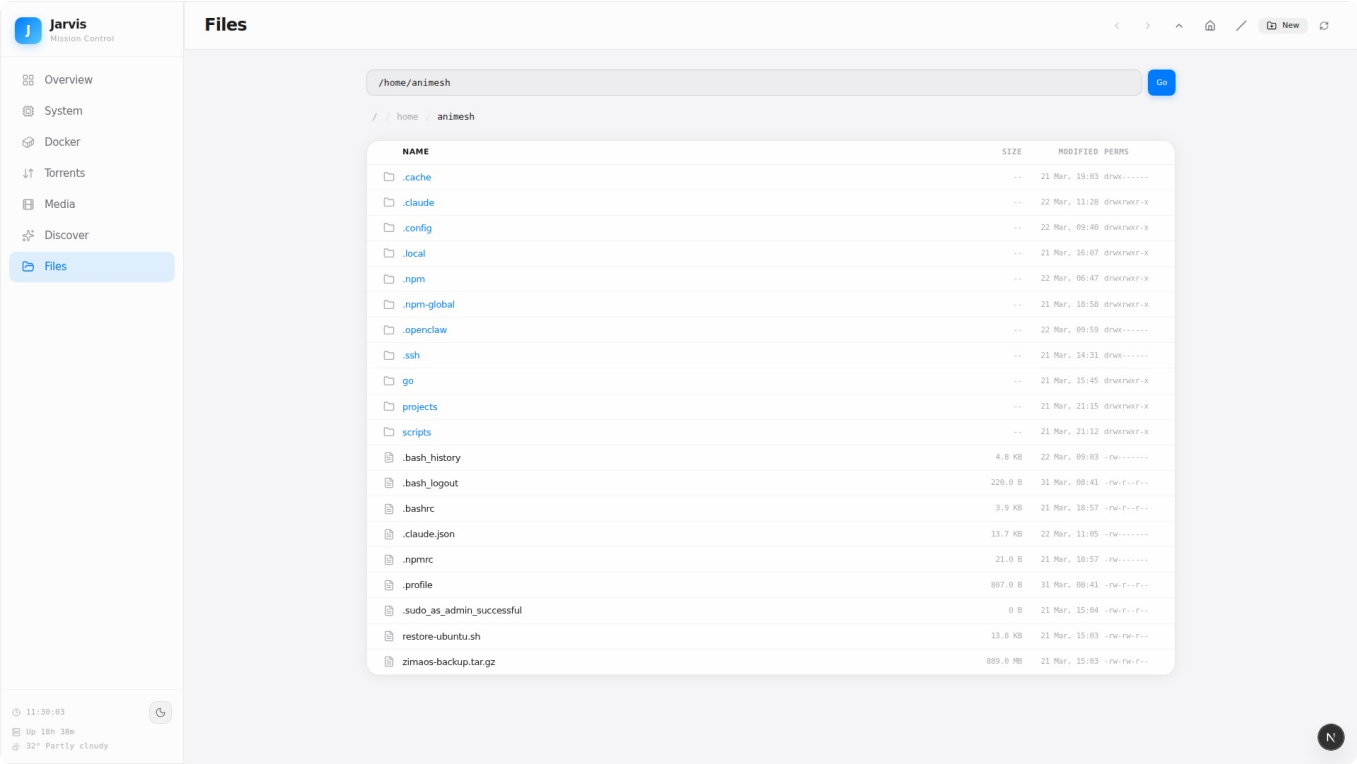
Jellyfin Media Library

Library stats (movies, series, episodes), recently added items, and active streaming sessions.



File Explorer

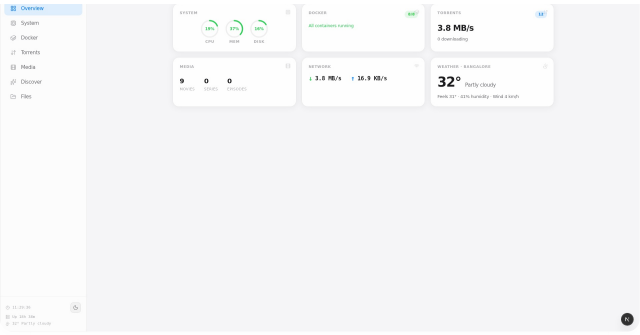
Full filesystem browser with breadcrumb navigation, rename, copy, move, delete, and download.

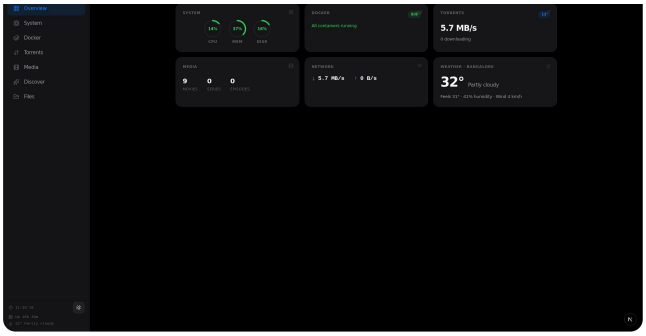


Dark & Light Mode

Toggle between themes. Preference is saved and respects your system setting.

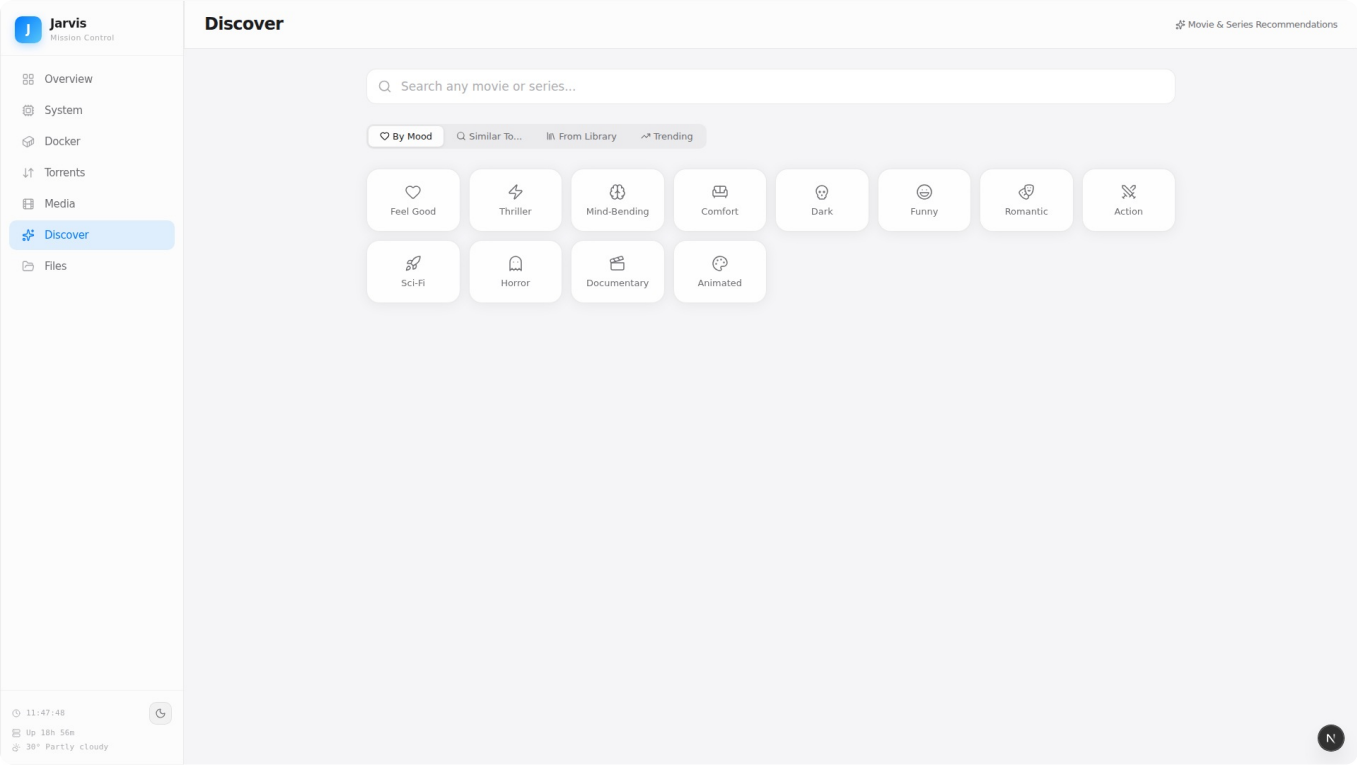
Dark Mode	Light Mode





Recommendation Engine — How It Works

Mode	What it does
By Mood	Pick from 12 moods (Feel Good, Thriller, Mind-Bending, Horror, etc.) — returns curated picks from Reddit's community wiki
Similar To	Type a movie name with autocomplete, get similar titles from TMDB + Reddit community data
From Library	Analyzes your Jellyfin library genres and recommends titles you don't already own
Trending	Reddit's community-voted monthly top 100 movies



Data sources:

- **Reddit r/MovieSuggestions wiki** — 2,896 movies across 120 hand-curated categories, parsed and indexed locally. Categories like *Action > Hidden Badass*, *Thriller > Mindfuck*, *Comedy > Mockumentary*, *Drama > Coming of Age*.
- **TMDB API** — Movie details, cast, posters, ratings, and recommendation engine.
- **Knowledge base is cached for 24 hours** — no rate limiting issues, instant responses.

Every recommendation card has a **"Find Torrent"** button. Click it, pick a torrent from the search results, and it's added to qBittorrent. The movie shows up in Jellyfin once downloaded and imported. **Discover → Download → Watch — all from one interface.**

Architecture

```
Browser ──→ Next.js (3000) ──→ Python Backend (8002) ──┬──→ Docker CLI
                                                       ├──→ Jellyfin API (8096)
                                                       ├──→ qBittorrent API (8080)
                                                       ├──→ TMDB API
                                                       ├──→ Reddit Wiki
                                                       └──→ System (/proc, du, etc.)
```

Layer	Tech
Frontend	Next.js 16, React 19, TypeScript, SCSS Modules
Backend	Python 3 stdlib — single `server.py`, zero pip dependencies
Icons	Lucide React
Theme	CSS variables + localStorage
Data	Jellyfin, qBittorrent, Docker, TMDB, Reddit Wiki, wttr.in

The backend is a **single Python file** using the standard library's `ThreadingHTTPServer`. No Flask, no Django, no `pip install`. It proxies API calls (avoiding CORS), runs system commands via subprocess, scrapes Reddit wikis, and caches TMDB responses. ~1,600 lines of code.

Quick Start

```
# Clone
git clone https://github.com/Animesh98/jarvis-dashboard.git
cd jarvis-dashboard

# Configure
cp .env.example .env
# Edit .env:
#   JELLYFIN_API_KEY=your_key
#   QBIT_USER=admin
#   QBIT_PASS=your_password
#   TMDB_API_KEY=your_tmdb_key  (free at themoviedb.org)

# Start backend
python3 server.py &

# Start frontend
cd frontend && npm install && npm run dev

# Open http://localhost:3000
```

Requirements: Python 3.8+, Node.js 18+, Docker, Jellyfin, qBittorrent on the same network.

▼ Full API Reference (30+ endpoints)

System

Method	Endpoint	Description
GET	`/api/system`	CPU, memory, disk, uptime
GET	`/api/processes`	Top 10 processes by CPU and memory

GET	`/api/processes`	Top 10 processes by CPU and memory
GET	`/api/storage`	Media directory sizes (cached 5min)
GET	`/api/weather`	Weather via wttr.in (cached 15min)
GET	`/api/bandwidth/history`	Network speed history (last 30min)

Docker

Method	Endpoint	Description
GET	`/api/docker/containers`	List all containers with status
GET	`/api/docker/stats`	Container resource usage
GET	`/api/docker/logs?container=X&lines=N`	Container log output
POST	`/api/docker/action`	Start, stop, or restart a container

Torrents

Method	Endpoint	Description
GET	`/api/torrent-search?q=X`	Search torrents via apibay
POST	`/api/torrent-add`	Add magnet link to qBittorrent
GET/POST	`/api/qbit/*`	Proxy to qBittorrent Web API

Media

Method	Endpoint	Description
GET	`/api/jellyfin/*`	Proxy to Jellyfin API

Recommendations

Method	Endpoint	Description
GET	`/api/recommendations/mood?mood=X`	Recommendations by mood
GET	`/api/recommendations/similar?title=X`	Find similar titles
GET	`/api/recommendations/library`	Recommendations from Jellyfin library analysis
GET	`/api/recommendations/trending`	Monthly top 100 from Reddit
GET	`/api/recommendations/categories`	List all 120 wiki categories
GET	`/api/recommendations/autocomplete?q=X`	Title autocomplete
GET	`/api/recommendations/search?q=X`	Full TMDB multi-search
GET	`/api/recommendations/detail?tmdb_id=X&type=Y`	Full movie/series detail

Files

Method	Endpoint	Description
GET	`/api/files/list?path=X`	List directory contents

GET	`/api/files/list?path=X`	List directory contents
GET	`/api/files/download?path=X`	Download a file
POST	`/api/files/delete`	Delete file or directory
POST	`/api/files/move`	Move file or directory
POST	`/api/files/copy`	Copy file or directory
POST	`/api/files/mkdir`	Create directory
POST	`/api/files/rename`	Rename file or directory

Quick Actions

Method	Endpoint	Description
POST	`/api/actions/jellyfin-scan`	Trigger Jellyfin library scan
POST	`/api/actions/clean-torrents`	Remove completed torrents
POST	`/api/actions/docker-prune`	Prune unused Docker resources
POST	`/api/actions/update-check`	Check for system updates
